Congratulations!

You're one of a handful of students to land a junior internship at G4Tech Cyber Security! Here, you've been learning all about the different ways people can keep their personal information safe and secure as they enjoy working, playing games, and talking with friends and family online.

Things have been going really well at your internship. Until today, that is. Today, you learned that hackers are trying to get students' passwords so they can log into their accounts and cause trouble at your school. It's important that everyone keeps their passwords safe and secure!

The cybersecurity experts at G4Tech are sure everything will be fine if students just follow the five basic rules for creating secure passwords, but unfortunately, the rules are hidden in a puzzle no one can seem to crack!

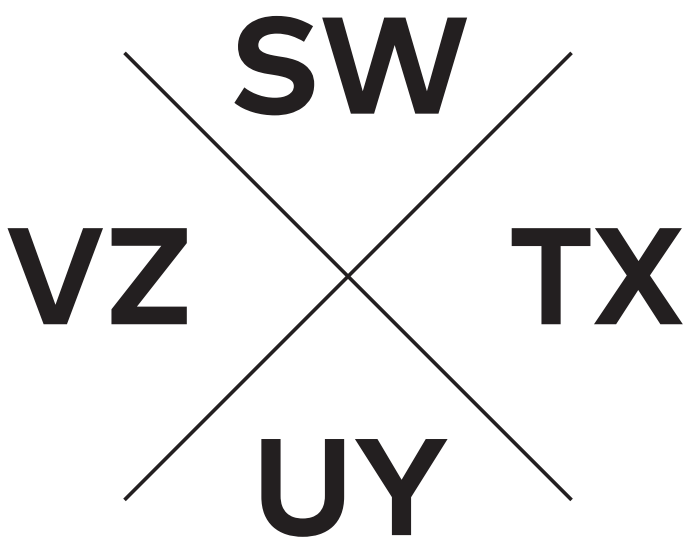

Can you and your fellow interns solve the puzzle and find the five rules your classmates need in order to stop the hackers?

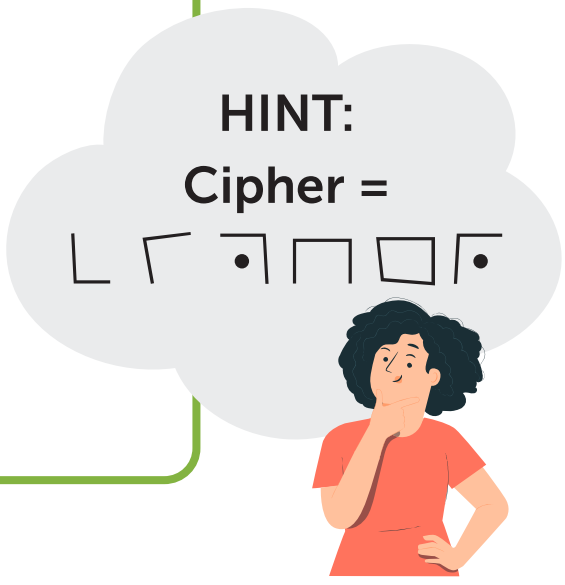

You'll have to work together and quickly!

How Safe Is Your Password?

Directions: Use the pigpen cipher below to unscramble the "5 Rules for Creating a Safe, Secure Password." Once all five rules are unscrambled, answer the reflection questions. When you're finished, raise your hand so your teacher can come check your work. Good luck!

DID YOU KNOW?

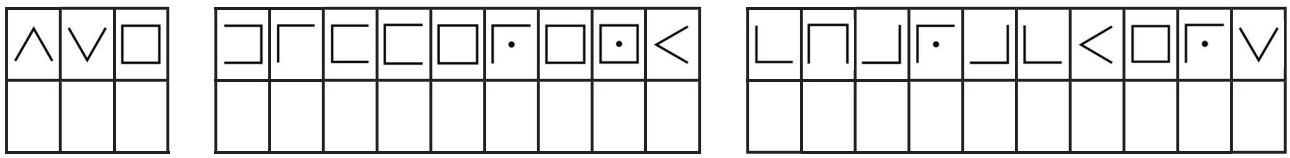

Pigpen ciphers are very old—they go back to at least the 18th century! They are a type of secret code called "substitution ciphers." This means each letter of the alphabet is replaced with a symbol.

5 Rules for Creating a Safe, Secure Password

Rule 1:

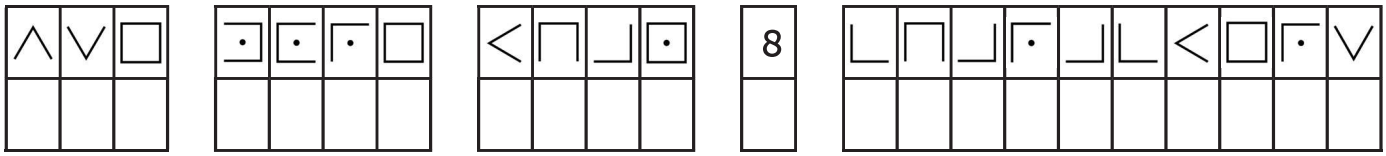

Rule 2:

Rule 3:

Rule 4:

Rule 5:

Reflection Questions

Draw an "X" on the line below to indicate how safe you think your current passwords are based on what you've learned in this activity.

Not secure — Somewhat secure — Very secure

Based on your learning, will you be changing any of your passwords? Why or why not?
